### OBJECTIVES

The course will allow students to interact directly with the multifaceted, cross-cultural horizon of premodern European science and its philosophical groundings. By engaging with theories of matter at three distinct levels (elemental mixtures, elements, and the matter of the elements), the students will appreciate the diverse plurality of cultural and linguistic settings in which these theories were formulated and discussed in the Middle Ages. The course is structured into:

introductory lectures on medieval natural philosophy comments on selected primary texts in translation (included in the course reader) expanding on theories of elements and mixtures in the Latinate, Islamicate, and Greek traditions a set of backward-designed activities, such as classroom debates, discussion of case-studies, and think-pair-share This hands-on approach to is aimed to nurture the students' independent engagement with the course materials and the scientific and philosophical theories discussed by medieval practitioners. Upon completion of the course, students will have acquired a critical approach to independently read and understand philosophical and scientific texts in their historical context. They will also have cultivated a personal way to creatively transform and adapt their acquired knowledge to new situations and contexts, on and off campus.
